Scientific Interests:

Dr. Izpisua Belmonte's area of research is focused on the understanding of stem cell biology, organ and tissue development and regeneration. His observations include uncovering the role of some homeobox genes in organ and specification, as well as the identification of the molecular mechanisms that determine how the different cell type precursors of internal organs are organized spatially along the embryonic body axes. He has made seminal discoveries in the field of tissue and organ regeneration, the differentiation of human stem cells into various tissues, and the molecular basis underlying aging and somatic cell reprogramming. These observations may help towards the discovery of new molecules as well as specific cell based treatments for a wide variety of diseases afflicting mankind.
